

Google Fiber Dashboard Executive Summary

Overview

This project seeks to quantify the frequency of repeat calls in Google Fiber’s customer support service and analyze trends among three different markets and problem types.

The Problem

Repeat customer contacts measure the inability to resolve the customer issues upon first contact. Google Fiber seeks to improve the customer experience and optimize customer service effectiveness.

The Solution

We have created a dashboard which tracks repeat support calls as a callback ratio by both issue and market type as well as over time to find trends and determine data based solutions. Trends can be filtered by week, month, Quarter, and Year.

Details

Keys to Success

- Quantify repeat call ratio
- Determine markets with highest repeat calls.
- Determine issues with highest repeat call ratio.
- Determine if the callback ratios are approximately equal between markets or whether the ratios are market specific.

Average Callback Ratio by Week

Date Created / Week of Date Created			
Week 6	Week 7	Week 8	Week 9
January 30, 2022	February 6, 2022	February 13, 2022	February 20, 2022
0.3333	0.5524	0.4095	0.5238

Key Findings: Account Management in the New York market has the highest callback ratio at 2.16 The next highest callback ratio is scheduling in the New York Market at 0.77. The third highest ratio is scheduling in the San Francisco Market at 0.54.

Reflections / Next Steps

- There is a high concentration of repeat calls in the New York market. Investigation as to why is recommended.
- Prioritizing the Account Management issue in the New York market will go a long way towards improving customer experience and optimizing the customer service process.
- The next two issues that should be addressed are the New York and San Francisco scheduling issues.
- It is recommended to investigate why there are much higher repeat call ratios for scheduling in these two markets vs. Chicago.
- Weeks 7 and 9 had the two highest spikes in repeat calls. Further investigation may provide additional context into the nature of these patterns.
